Blockchain: The Invisible Technology That's Changing the World

Blockchain-based networks, decentralized apps (DApps), and distributed ledgers are becoming the foundation of much of your digital life. There's a new immutable digital fabric remaking the internet beneath us, and you probably don't even realize it.

What is blockchain?

A Distributed, Decentralized, Ledger with some special, very valuable properties

- Ascertains Trust between unknown parties
- Its Records are Immutable (Incorruptible)
- Result: Disintermediation
- Result: Costs/Speed

Information is Encrypted and new **Blocks** are **Chained** to previous ones

Disruptive Changes: Traditional Internet

- ▶ **Traditional Internet of Communications/Information**
(Sending/receiving emails, searching Google, Tweeting, using Facebook, listening to music, watching videos, buying things on line, ordering a taxi, getting money from ATM etc.)
 - Implications for
 - > The advertising revenues of Mass Media
 - > Travel agents issuing tickets
 - > Bookstores and other retailers
 - > Phone operators
 - > Postal workers
 - > Bank tellers
 - > Job recruiters
 - > **Librarians**
 - > etc., etc.

**Blockchain is today where the Internet
was in the middle of 1990s**

WHY THE WEB WON'T BE NIRVANA

BY **CLIFFORD STOLL** ON 2/26/95 AT 7:00 PM

“Baloney. Do our computer pundits lack all common sense? The truth is no online database will replace your daily newspaper, no CD-ROM can take the place of a competent teacher and no computer network will change the way government works”.

Disruptive Changes: Internet of Value (Being Created using Blockchain)

The Internet of Value using Blockchain (Securely trading virtual currencies, Transferring money for \$2 instead of \$20, Drawing/Executing wills with smart contracts, eHealth records, Land registry certificates etc.)

► Implications for

- Travel agents booking vacations
- Taxi and Lorry drivers
- Language translators
- Bankers, Investment analysts/Portfolio executives
- Lawyers
- X-ray, CT scan and eventually many other doctors
- Car Companies and Auto Dealers
- Supervisors and Managers
- Professors

and Network firms ?**

AI: A revolutionary technology that teaches machines to think/learn on their **own** by analyzing and discovering patterns in massive data/info

Driverless Cars Could Reduce Traffic Fatalities by Up to 90%, Says Report

They're set to have one of the biggest impacts on public health ever.

China wants to be a \$150 billion world leader in AI in less than 15 years

- China laid out plans to become a world leader in artificial intelligence (AI) by 2030.
- The government aims to make the AI industry worth \$150 billion.
- China's three step program outlines its aim to use AI in a number of areas from the military to smart cities.

Putin: Leader in artificial intelligence will rule world

- Putin says that whoever reaches a breakthrough in developing artificial intelligence will come to dominate the world.
- Putin warned that "it would be strongly undesirable if someone wins a monopolist position".

Combining Blockchain and AI

First "Alliance for Development of Artificial Intelligence and Block Chain Technologies" Will Be Established in China for Development of Integration of the Two Technologies

BEIJING, [Sept. 5, 2017](#) /PRNewswire/ -- "Seminar of Artificial Intelligence and Block Chain Technologies" was held in Tsinghua University on September 3rd, during which it was proposed to establish the "Alliance for Development of Artificial Intelligence and Block Chain Technologies" (ABCD Alliance for short). The alliance, which will become the first alliance committed to development of integration of AI (Artificial Intelligence) and block chain technologies in China, aims at promoting integration and long-term development of "artificial intelligence and block chain", advancing innovation for the two technologies and other relevant

Value Added

- Security
- Reliability
- Lower Costs
- Greater Speed
- Standardization
- Cloud Services

Integrating AI and Blockchain (BC): Few Applications Great Prospects

- ▶ **Government:** Little BC (apart from exceptions), none AI
- ▶ **Health:** Some BC, Very little AI
- ▶ **Banking/FinTech:** Banking mostly BC, FinTech mostly AI
- ▶ **AV:** All AI, **Needs a lot of BC** **Consider Terrorist Attacks**
- ▶ **IoT:** Mostly BC, Needs AI
- ▶ **Supply Chain:** Mostly BC, logistics mostly AI, Needs Both
- ▶ **Smart Contracts:** All BC, little AI, Must Integrate the TWO
- ▶ **DAO:** All BC, little AI, Must Integrate the TWO

Combining Blockchain and AI: Still in its Infancy

Estonia's eHealth System: The closest you can get in combining AI and Blockchain

Personalized Medicine

healthcare

Estonia's healthcare system has been revolutionized by innovative e-solutions. Patients and doctors, not to mention hospitals and the government benefit from the convenient access and savings that e-services have delivered.

Each person in Estonia that has visited a doctor has an online e-Health record that can be tracked. In order to keep health information completely secure and at the same time accessible to authorised individuals, the electronic ID-card system uses KSI Blockchain technology to ensure data integrity and mitigate internal threats to the data.

IBM's Watson and DeepMind's Work on AI in Health

The University of Texas, “is using the IBM Watson cognitive computing system for its mission to eradicate cancer.” **Well, now that future is past.** The partnership between IBM and one of the world’s top cancer research institutions is falling apart. It is confirmed that the project (having cost \$62 m) is on hold since late last year.

On AI research, we (DeepMind) are undertaking research partnerships with world-class hospital groups Moorfields and UCLH, **exploring** whether AI techniques can be used effectively and safely to support nurses and doctors. The results of this work **will be subject** to rigorous clinical scrutiny and will be published in peer-reviewed academic journals

How Blockchain Technology Spawned Virtual Currencies

Blockchain technology, less commonly known as distributed ledger technology (DLT), is the underlying foundation that can create shared digital databases of entries that are unchangeable.

Initially, the tech's developers conceived it as a way to centralize record-keeping (particularly of financial transactions) without the need for authorization by an third party. Instead, multiple users with access to the data can form the records.

The Massive Hedge Fund Betting on AI

Initially wary of the technology, Man Group was soon persuaded by the returns from algorithm-centric funds.

By **Adam Satariano** and **Nishant Kumar**

From **Bloomberg Markets**

The M4-Competition

As chief executive officer of one of the world's largest hedge funds, Luke Ellis prides himself on a healthy appetite for risk. "My job," he says, "is to not blink." About five years ago, he did, though—in a big way. What spooked him was an experiment at his firm, Man Group Plc. Engineers at the company's technology-centric AHL unit had been dabbling with artificial intelligence—a buzzy, albeit not widely used, technology at the time. The system they built evolved autonomously, finding moneymaking strategies humans had missed. The results were startlingly good, and now Ellis and fellow executives needed to figure out their next move.

Autonomous Vehicles

- ▶ Blockchain technology and AI would allow Autonomous Vehicles (AV) to be truly autonomous. This means that they could refuel, recharge and park on their own and pay for those services as well as for tune-ups, oil changes or whatever other services needed
- ▶ The blockchain will assign each AV a digital identity that can follow it, using GPS, everywhere, time-stamping its location and providing instructions of what to do next
- ▶ AI will utilize the data collected to determine traffic patterns and speed up the time of journeys
- ▶ Blockchain and AI will allow full interconnectivity of all AV on the road, minimizing accidents, coordinating the flow of traffic and optimizing the routes to follow

IoT

- ▶ **Blockchain could revolutionize the IoT if applied securely to the estimated 8.5 to 20 billion of connected IoT devices that exist in 2017. Exploiting the information they will generate using AI can transform our homes and cities and have a profound effect on our life's quality**
- ▶ **AI can provide important advantages optimizing the functioning of all IoT devices, allowing the trading of digital assets, the automatic ordering of goods and services and the enactment of smart contracts.**
- ▶ **Eciotify, a startup, specializes in applying blockchain to the IoT and enabling the use of Smart Contracts between IoT devices.**

Artificial Intelligence: The next big thing in Supply Chain Management

Imagine the endless possibilities of learning from 2.5 quintillion bytes of data generated every day. Artificial intelligence (AI), which began its journey 60 years ago is well on its course to make this implausible scenario a reality. Artificial Intelligence, is slowly taking over our lives.

Supply Chain (SC)

- ▶ **Blockchain can save hundreds of billions by eliminating**
 - Paper-based procedures
 - Letter of credits and factoring
 - Detailed inspections
- ▶ **AI is being used at present for the logistics part (scheduling and planning) of SC but can be extended in the future for the majority of SC transactions including ordering of material and parts**
- ▶ **Smart Contracts, in conjunction to AI, can further automate SC by specifying how things should be implemented**

Smart Contracts

- ▶ The purpose of smart contracts is the automation of business relations by reducing the need for paperwork and by eliminating intermediaries (e.g., lawyers) thus decreasing costs
- ▶ Wills and all sorts of Legal documents can be done using smart contracts (Ethereum allows the creation of smart contracts)
- ▶ AI can be incorporated into smart contracts assuring that they are legally binding and allowing their adaption in case of environmental changes

DAO (Decentralized Autonomous Organizations): Unlimited possibilities, Breakthrough implications

- ▶ **A DAO is an organization that exists as autonomous code on the blockchain, with no physical presence or employing people**
- ▶ **The code is embedded into a smart contract that is executed once the postulated conditions are met**
- ▶ **Anyone with an Internet connection can be a participant (owner), or a resource (work for a DAO)**
- ▶ **The code (smart contract) cannot be altered unless 51% of the participants agree**
- ▶ **People can participate in a DAO by buying tokens (bought and sold on exchanges)**
